Question 2:

➔ Implement arithmetic operations in shell scripts.

`#!/bin/bash`

Specifies Bash as the script interpreter.

`echo`

Displays a message or result on the terminal.

`read a` and `read b`

Accept two numbers from the user and store them in variables.

`$((a + b))`

Performs addition.

`$((a - b))`

Performs subtraction.

`$((a * b))`

Performs multiplication.

`$((a / b))`

Performs integer division in Bash.

`$((a % b))`

Calculates the remainder after division.

`[ "$b" -ne 0 ]`

Checks whether the second number is not equal to zero.

`if ... then ... else ... fi`
